

Repository Summary Report for scottyab/rootbeer

Method

The following report focuses on source files found in the RootBeer public repository. Source files were identified by files whose file name ended with .java, .kt, .cpp, or .h. Per source file the author history, dates of change, and times changed were recorded for the following analysis. This method of selection is purely limited to public or known repositories.

Significant findings

- Rootbeer.java surfaced as the most altered file. Having been changed 53 times, this identifies Roobar.java as a significant source file within the repository.
- Users Scott Alexander-Bown and Matthew Rollings matched in significant changes and contributed to files with 86 changes. This identifies them as significant contributors to the source files adaptation.
- Significant repository contributions were in higher concentration in the beginning of the project and began to dwindle to less significant changes as time went on. In 2015, 73 contributions were added into the repository, and only 41 contributions were recorded in 2017.

Visualization

The following plot displays the quantity of changes per week for each identified source file. Each row represents a different file, and each color references a different author.
