

Prepared by: Ethan Guillem
Analysis period: June 2015–March 2026

This report analyzes activity in the Rootbeer repository's Java, Kotlin, C, C++, and header source files. Documentation, build configuration, images, generated files, and compiled files were excluded. The analysis found 196 file touches across 36 current and historical source-file paths. A file touch means that one commit changed one source file.

RootBeer.java is the most frequently changed file. It was touched 40 times, accounting for 20.4% of all recorded source-file touches. The next most frequently changed files were **Const.java** with 17 touches and **MainActivity.java** with 11. This concentration suggests that **RootBeer.java** is a central file that may require extra attention during testing and maintenance.

Repository knowledge is concentrated among two contributors. Scott Alexander-Bown recorded 74 file touches and Matthew Rollings recorded 58. Together, they account for 132 of 196 touches, or 67.3% of the source-file activity. This may create a maintenance risk if knowledge of important files is not shared with other contributors.
