

Repository activity analysis | scottab/rootbeer | Source history: June 2015 - March 2026

Key Findings

The repository recorded **840 source-file touches in 2015**, with later bursts of **542 in 2017** and **376 in 2020**. Activity fell to **142 in 2024** and **17 in 2026 through March 5**; no selected-source-file activity was recorded in 2022, 2023, or 2025. This indicates substantially lower recent maintenance activity.

Matthew Rollings recorded 1,032 touches and Scott Alexander-Bown 679, compared with 221 for the third-highest contributor. This concentration suggests that a meaningful share of historical repository knowledge may reside with a small group.

RootBeer.java recorded **1,600 touches**, far above **Const.java (289)** and **MainActivity.java (121)**. Matthew Rollings accounts for **760 (47.5%)** of RootBeer.java touches; Rollings and Alexander-Bown together account for **62.5%**. This file merits attention for future maintenance and knowledge transfer.

[illegible]

Management takeaway

Recent activity is low relative to the repository's earlier years, while historical changes - especially to `RootBeer.java` - are concentrated among a small contributor group. Future maintenance should prioritize knowledge transfer around frequently changed core files.

Limitation

File-touch frequency measures repository activity, not the size, complexity, quality, or importance of a change. Source selection is extension-based, so build-related files may be included and unusual source files may be omitted.
