

RootBeer Repository - Executive Summary

Repository activity analysis | scottyab/rootbeer | Source history: June 2015 - March 2026

Analysis overview. This report summarizes GitHub source-file commit activity by contributor, date, and file. File-touch counts are used as an indicator of development and maintenance activity.

Key Findings

1. Development activity has declined from historical levels.

The repository recorded **68 source-file touches in 2015**, with later activity of **30 in 2017** and **25 in 2021**. Activity fell to **14 in 2024** and **1 in 2026 through March 5**; no selected-source-file activity was recorded in 2022, 2023, or 2025. This indicates substantially lower recent maintenance activity.

2. Historical activity is concentrated among a small contributor group.

Scott Alexander-Bown recorded **74 touches** and **Matthew Rollings** **58**, compared with **10** for the third-highest contributor, Daniel Kutik. Together, the top two contributors account for **132 of 196 touches (67.3%)**. This concentration suggests that a meaningful share of historical repository knowledge may reside with a small group.

3. RootBeer.java is the primary change hotspot.

RootBeer.java recorded **40 touches**, far above **Const.java (17)** and **MainActivity.java (11)**. Matthew Rollings accounts for **19 (47.5%)** of RootBeer.java touches; Rollings and Alexander-Bown together account for **62.5%**. This file merits attention for future maintenance and knowledge transfer.

Repository Activity Visualization

Figure 1. Each point represents a contributor modifying a source file during a particular week. The x-axis shows weeks since the repository began, the y-axis identifies source files, and color distinguishes contributors. The clustering of points makes periods of concentrated development visible and shows the lower level of activity later in the repository history.

Management takeaway

Recent activity is low relative to the repository's earlier years, while historical changes - especially to RootBeer.java - are concentrated among a small contributor group. Future maintenance should prioritize knowledge transfer around frequently changed core files.

Limitation

File-touch frequency measures repository activity, not the size, complexity, quality, or importance of a change. Source selection is extension-based, so unusual source files may be omitted. The analysis also reflects commit history rather than the actual effort required for each change.
