

Executive Summary

Description:

This project analyzed the amount of file touches made in the Rootbeer file directory. The results were made into a color-coded scatter plot. This offers a visual breakdown of what author changed any file(s) and how many times.

Significant Findings:

The primary contributor was Alexander-Brown (shown in light green below). Other findings include limited adjustments to the repo since 2025, meaning this repo has not been active for a little while.

Scatter Plot of Findings:

Explanation:

The visualization shows the amount of file touches which are color-coded by author and separated by dates. This allows people to see which author has contributed and how many times.

Limitation of Analysis:

A limitation of the visualization itself is that it is hard to tell what specific file had been altered and to what effect it was altered.
