

Repository Summary Report for scottyab/rootbeer

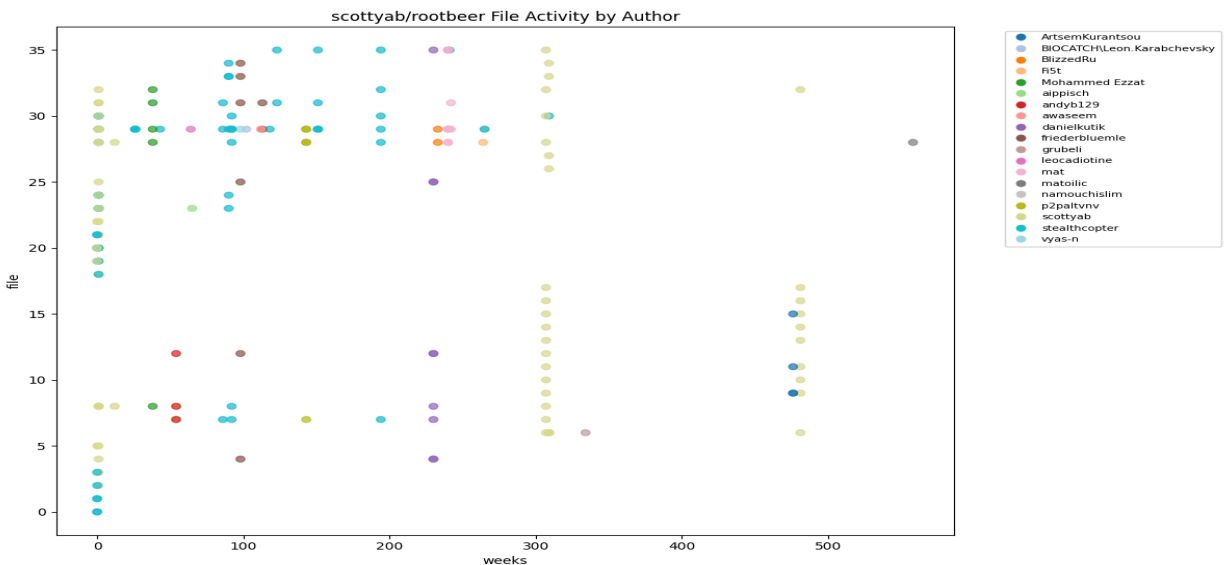

Analysis

This report consists of source files in scottyab/rootbeer, ranging from Java, Kotlin, C/C++, header, and test files, but excluding build output and generated code. In addition to this, the history of every commit that touched these files are recorded. Each touch was plotted by the week it occurred since the repository's first commit, which file it affected, and which author made the change.

Key Findings

- Two contributors account for most of the work. scottyab (74 touches, 34 of 36 files) and stealthcopter (65 touches, 20 files) together made 71% of all recorded changes. No one else exceeded 10 touches, indicating a very small core maintainer group throughout the project's life.
- RootBeer.java is a maintenance hotspot with broad exposure. The library's central class was touched 40 times, more than double any other file by 12 different authors. This suggests that it is both central to the library's purpose and a recurring source of fixes.
- Recent activity is thin and concentrated. The two years before the latest commit saw only 15 touches (8% of all activity), mostly from scottyab plus a brief contribution from ArtsemKurantsou in August 2024, suggesting the project is largely in maintenance mode.

Visualization

Each point is one author changing one source file during one week since the repository's first commit. Color indicates author. Dense vertical bands mark bursts of activity across many files, while long horizontal gaps for a file show extended periods with no changes.
